

ABSTRACT

1 A transmission device for driving a name card to pass over a contact image
2 sensor (CIS) comprises: a loading deck provided with a central recess and a
3 correction slip attached to a bottom face at the front end thereof; a first gear set for
4 driving the loading deck; a second gear set fixed oppositely on the same gear shaft
5 of the first gear set for driving the loading deck; and a motor for driving the first
6 gear set.
